

Key to protect your private
and confidential data

Is your
DATA
safe?

EasySafe™ is your solution to protect the confidential files in your computer and/or any external storage medium. You can store your important documents, pictures, photographs without the fear of others viewing or knowing it, not even when you lose your computer or your external storage devices.

easySafe™ is the only hardware cryptography product available in the market with unique features. It combines the most popular hardware authentication and software encryption techniques in one single USB interface token.

Unlike Password Login or Fingerprint PC lock, easySafe does not lock your entire PC but secures only your selected data. This keeps your confidential data safe even when others use your PC. It is very useful when someone is sharing, servicing or repairing your PC.

1. Strong Authentication

easySafe offers a strong authentication alternative that replaces Windows password login control. The user login is controlled by easySafe token which is a separate hardware from the computer and cannot be traced or recorded as compared to generic software password. The computer will be locked when the token is unplugged from it.

2. Data Protection

EasySafe provides data protection by generating an encrypted "virtual" disk drive in the computer. Users can easily store their sensitive and valuable data in this electronic vault. They can create, save, move and copy files on it in exactly the same way as they have always done without noticing any difference between using the "virtual" disk drive and a "normal" one.

3. Plug and Play Device

EasySafe™ is a plug and play device. All security control is built in to the hardware device, easyKey. It is more secure than any encryption software as the encryption key is separated from the protected information.

4. Strong Encryption

EasySafe protects sensitive information with international standard encryption algorithm (3DES, AES).

easyDrive and easyKey

EasySafe™ comes with 2 revolutionary inventions: **easyDrive** and **easyKey**.

easyDrive is specially designed with encrypted storage space that securely stores your information. The encryption operation is integrated into standard Windows file management system – when you save, move or copy a file to/from the easyDrive, the file will be encrypted or decrypted automatically and is transparent to users.

easyKey stores the encryption key in a device that plugs in to a computer's USB port. Plug in the easyKey, the easyDrive will open and appears as an additional disk drive in your windows system. Remove the easyKey, easyDrive automatically closes and disk drive will be vanished from your windows system.
